Subject: Co-located sediment tissue sample request
Date: 11/03/2005 09:35 AM

Eric and Jordan,

In our Eco Team meeting this week, during our discussion of BSAFs, we identified the need to evaluate the sculpin tissue/sediment co-located samples, and the crayfish tissue/sediment co-located samples taken by the LWG to determine the strength/quality of the tissue-sediment relationship. We'd like the LWG to give us a spreadsheet of the information they collected, including parameters for the co-located samples (grain size, organic carbon, date each sample was taken, spatial separation of each "co-located" sample, indication of which composite sample each individual sculpin was made part of, etc.).

Jordan - do you know if this data exists on the portal already, in a form that we can easily pull together ourselves? If not, Eric and Chip will need to request it from the LWG. Our thought was that we might be able to pull it together before the November 9 integration team meeting, but my guess is that that's not really feasible. I'd love any thoughts you have on this.

Thanks,
Mikell
